

ABSTRACT

Supply system (10) for a silk-screen printing machine comprising a supply table (20) mobile on longitudinal guides (22) in a longitudinal advancing direction (F) of a sheet (12) able to be registered longitudinally through longitudinal registering means (60), the supply system (10) comprising transversal registering means (40) which comprise locking means (50) suitable for locking the sheet (12) on the supply table (20) for a predetermined time and an actuator (24) to move the supply table (20) in a direction transversal to the longitudinal direction (F) such as to allow the registering of the transversal position of the sheet (12) without misaligning it with respect to the longitudinal direction (F).
